Memo to File:

Re: Riter Ekker and Don Ekker Partnership  
Mountain King Mine  
ACT/015/023

The Mountain King Mine was inspected on March 19, 1979 by Mike Thompson. The mine is located adjacent to the road that runs between Goblin Valley and the Flat Top Mesa.

The proposed mining method is to first glean uranium ore from existing waste piles. This portion of the plan has been initiated. Secondly, the soil and unconsolidated colluvium above a section of abandoned underground workings will be stockpiled. A section of overburden will then be removed and stockpiled after the existing workings have been caved. The ore will be removed and the next section of overburden will be hauled back to the pit created by the ore removal. The sequence will continue until all of the ore is removed from the 500 foot x 300 foot area. The initial stockpile of overburden will then be hauled back and the stockpiled colluvium and soil will be spread over the area.

The existing mine plan needs amendments concerning soil stockpiling and the proposed seed mixture. The plan will be again routed for comments and recommendations. The Board will be consulted at the March 29, 1979 meeting.
